The four formats are not ranked. They divide by what the contents need: a cavity, a wrap, a cushion, or volume. The mailer is the only one of the four that closes and recloses without a second consumable, which is why it carries the return leg.

Recycled content is banded here on purpose. A band is what compares across formats without implying a precision the formats do not share. The figure by weight, for this family, is on the features and benefits sheet.

Listings are named, not defined. What each mark certifies, and against which test, is on the features and benefits sheet.

CHOOSING BETWEEN THEM

Choose the corrugated mailer

When the contents are rigid or already boxed and want a defined cavity, when the category has returns, and when the pack bench matters — nothing has to be dispensed to close it. Budget for void fill; the cavity is fixed and the contents rarely are.

Choose the shipping carton

When the order is multi-item, heavy, or going onto a pallet. The RSC is the only one of the four rated above 16 kg, and the only one that makes sense once you are stacking several deep.

Choose the book-wrap mailer

When depth varies order to order and the contents are flat. The wrap folds down to the item, so there is no void to fill and no oversize charge on a thin order. It closes on adhesive, so it costs a consumable the mailer does not.

Choose the paper-padded envelope

When the contents are soft, light and need cushioning rather than a cavity — apparel, textiles, small accessories. It is the cheapest and smallest of the four in transit, and the least protective against a crushing load.

Against a plain slotted box of the same internal size, the mailer uses roughly a fifth more board and needs no tape. Whether that trades well depends on how much tape a bench gets through, not on the board figure alone.

Loads, board grades and closures are taken from the CambiumPak product specification. The corrugated mailer and the shipping carton are ratified catalogue families. Figures for the book-wrap mailer and the paper-padded envelope are inferred from the nearest ratified family member and are not yet in the published catalogue.
